EatRight – Project Report

Name: Yashvi Khare

Reg.no: 25BCE10725

Course: Fundamentals In AIML

Course Code : CSA2001

Slot: A21-A22-A23

Project Title: EatRight (AI Diet Planner)

Date: 31/03/2026

1. Introduction

The Free AI Diet Planner is a browser-based application designed to help users maintain a healthy lifestyle. The system provides BMI calculation, daily water intake suggestions, exercise recommendations, weekly meal plans, and a built-in AI chat assistant for dietary guidance.

This project is fully offline and requires no API key or backend, making it free and accessible for all users.

2. Objectives

- To calculate BMI and classify users into standard categories.
- To suggest daily water intake based on weight.
- To provide exercise recommendations according to user goals (lose, gain, maintain).
- To generate a weekly meal plan tailored to vegetarian or non-vegetarian preferences.

- To implement a chat assistant that answers diet-related questions and provides guidance.

3. Scope

This application is intended for beginners, students, and anyone seeking basic dietary guidance. It is browser-friendly and compatible with modern browsers such as Chrome, Firefox, and Safari.

4. Features

1. BMI Calculator – Calculates BMI using weight and height; displays categories like Underweight, Normal, Overweight, or Obese.

2. Water Intake Tracker – Suggests daily water intake with visual indicators.

3. Exercise Recommendations – Personalized suggestions based on weight management goals.

4. Weekly Meal Planner – Generates breakfast, lunch, and dinner for 7 days; supports vegetarian and non-vegetarian diets.

5. AI Chat Assistant – Answers diet and health-related queries using pre-coded intelligent responses.

5. Technologies Used

- HTML5 – Structure and layout.

- CSS3 – Styling and responsive design.

- JavaScript – Logic for BMI calculation, meal plan generation, and AI chat functionality.

6. System Design

The system is a single-page browser application with four main sections:

1. User Input Section – Collects Name, Age, Weight, Height, Goal, and Diet Type.
2. BMI & Health Section – Displays calculated BMI, water intake, and exercise suggestions.
3. Weekly Meal Plan Section – Shows a 7-day meal plan in a table format.
4. AI Chat Section – Allows users to ask questions and receive instant diet guidance.

The AI chat uses pre-coded responses, making it fully functional offline.

7. Advantages

- Offline & Free: No API key or backend needed
- User-Friendly: Easy to navigate, minimal technical knowledge required
- Personalized Guidance: Tailored exercise and diet recommendations
- Accessible: Works on all modern browsers

8. Limitations

- AI chat provides limited responses compared to real AI models like GPT-3.

- Meal plans are pre-programmed and randomized, not dynamically generated from a nutrition database.
- Advanced features like calorie tracking and nutrition analysis are not included.

9. Conclusion

The Free AI Diet Planner is a simple yet effective tool for users to monitor their health and maintain a balanced diet. It combines BMI calculation, meal planning, exercise guidance, and a fun AI chat assistant in a single browser-based application.

Being offline, free, and easy to use, it is suitable for students, beginners, and anyone looking to improve their health habits.
